Data Analysis Report

Uncovering Insights from Learner Enrollment Patterns

40	8	23.3
Total Students	Courses Offered	Avg Age

Prepared by Samuel Oyedokun | May 2026

THE DATASET

Sample of 40 student registrations collected across May 2026

ID	Name	Course	Gender	Age	Date
1	Chidi Obi	Data Analysis	Male	20	1/5/2026
2	Amaka Okafor	Web Development	Female	21	3/5/2026
3	Seun Ajibola	Digital Marketing	Male	24	9/5/2026
4	Nana Hawa	Data Analysis	Female	25	4/5/2026
5	Mike Opara	Front End Developer	Male	23	3/5/2026
6	Oke Paul	Back End Developer	Male	20	4/5/2026
7	John Paul	UI/UX Design	Male	22	5/5/2026
8	Dorcas Ojo	Video Editor	Female	26	5/5/2026

Showing 8 of 40 records | Fields: ID, Name, Course, Gender, Age, Registration Date

KEY FINDINGS

40

Total Registrations

Students enrolled across 8 courses

27.5%

Top Course Share

Data Analysis most selected

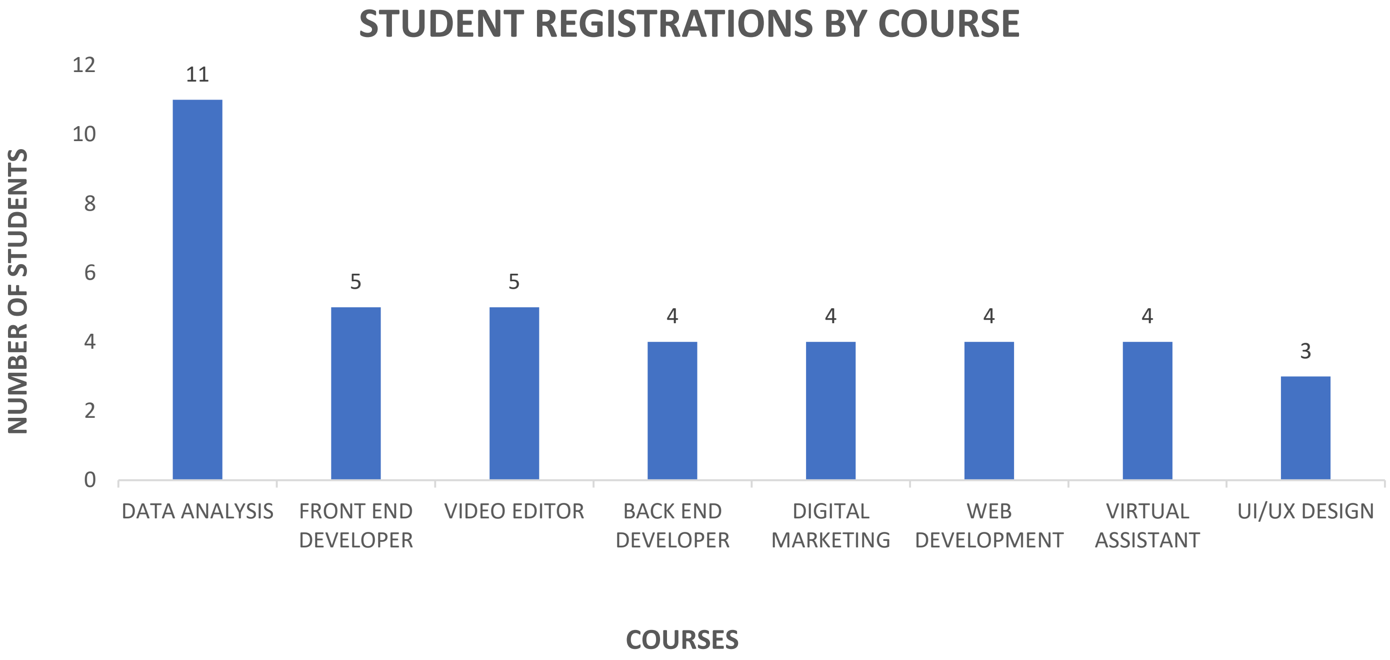
5

Course Average

Average students per course

These three metrics give us a quick, high-level understanding of our student population.

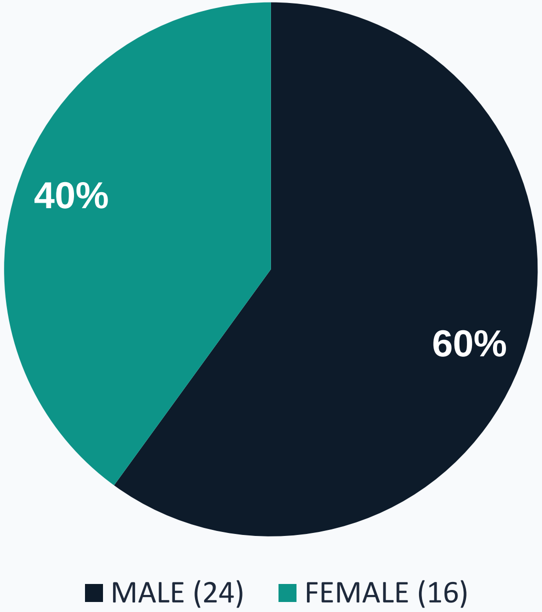
COURSE DISTRIBUTION



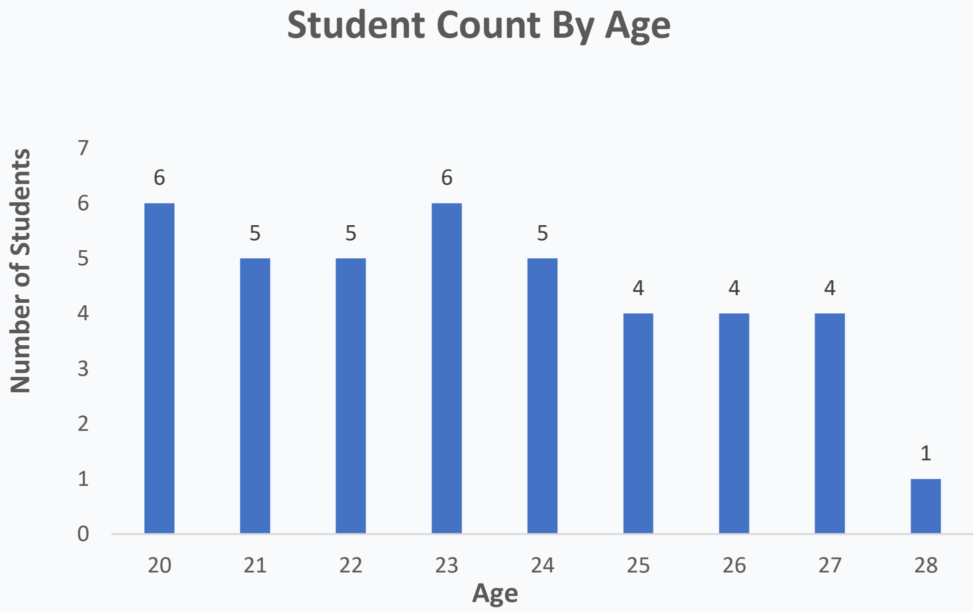
Data Analysis leads with 11 enrolments (27.5%) — the most popular course by far.

STUDENTS DEMOGRAPHICS

Gender Distribution



Age Distribution



Female: 16 (40%)   Male: 24 (60%)   Avg Age: 23.3 yrs

OBSERVATIONS & RECOMMENDATIONS

Most Popular Course

With 27.5% of students choosing Data Analysis, there is clearly high demand. Consider offering advanced or follow-up modules to keep learners engaged.

Age Group Focus

Students aged 20–24 make up 68% of enrollments. Marketing should target young adults and recent school leavers.

Gender Representation

60% Male (24) vs 40% Female (16). Encouraging female participation in tech-focused courses should be a priority.

Diversify Course Offerings

Most of the courses have 3–4 students. Targeted promotion for undersubscribed courses could help balance enrollment.

FACILITATOR APPROACH

How I Approached the Data

- Created all 40 student records and reviewed fields
- Counted registrations per course to find frequency
- Sorted results to rank from highest to lowest
- Calculated percentages for easy comparison
- Segmented by gender and age to explore demographics

How I Interpreted Results

- High Data Analysis enrollment = strong market demand
- Young average age = fresh graduates or early career changers
- Gender imbalance = Encourage Female Participation
- Low enrollment in some courses = promotion gap

How to Teach Beginners

- Use familiar, relatable datasets (school, market, sports)
- Start with questions, not formulas
- Build intuition through counting and observation
- Visualise every insight — charts over tables
- Ask 'so what?' after every number discussed

TEACHING BEGINNERS TO THINK WITH DATA

1. **Ask a Question First**

   Always begin with a question. e.g. 'Which course do most students choose?' or 'Are more males or females signing up?' The question gives your analysis direction and purpose. Data is the tool to answer real questions.

2. **Observe, Don't Assume – Look At The Data**

   Look at what the numbers actually say, 11 out of 40 chose Data Analysis. That's a fact. 'Everyone loves data' is an assumption. Count, sort, and group the records. Use the raw data — names, courses, genders, ages.

3. **Visualize to Understand**

   A chart tells a story at a glance. Show learners how a chart reveals patterns that a table hides.

4. **Draw a Conclusion**

   Make a statement based on evidence: 'Students prefer tech-driven careers.'

5. **Insight (Observation and Recommended Action)**

   Turn your observation into a statement: 'Students prefer Data Analysis because it aligns with growing industry demand.' Then recommend an action: 'Open a second Data Analysis cohort next quarter.'

Data Tells a Story.

Our job is to listen.

Thank You

Presented with clarity, purpose, and passion for teaching data.
